

Patient Assent Script

This is an example verbal consent script for the collection of rectal swabs to test for colonization by Carbapenemase-Producing Organisms (CPOs).

You may have recently been exposed to a person who has a germ called a carbapenem-producing organism (or CPO for short). It is normal for people to carry this kind of bacteria in their gut or stool. But this germ is resistant to important antibiotics used to treat infections.

The chance that you carry this germ is very low, and most people who have it don't get sick. If you do have it and get an infection, it can be very difficult to treat. So, it is important to know if you have it.

Because of this antibiotic resistance, we would like to identify if anyone else has it. That is why we are testing residents/patients on this unit today.

There is no cost to you for the test. The test is not painful and is done by collecting a swab from your rectum. To collect the swab, a "Q-tip" will be gently inserted into the opening of your rectum, gently rotated, and removed. The test results will take about a week.

If the test is positive, we will share that information with you. If it is negative, you won't hear from us.

Is it ok for me to get a swab now?

Note:

If the patient/resident is reluctant to have someone collect the swab, they may collect it themselves. Please provide collection instructions.

If the patient/resident declines the test, it may be helpful to ask them about their concerns. Reluctance can often be overcome by providing simple additional information.
